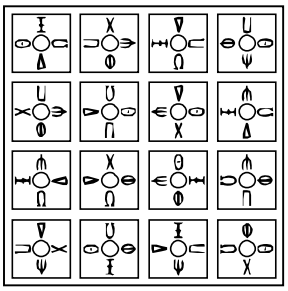
On the Subject of Twisty Terminals



It's all greek to me. I don't know, fiddle about with it.

- This module consists of a 4×4 grid of terminals, each with four transceivers facing orthogonal directions.
- There are eight types of transceiver, marked with distinct symbols.
  Adjacent terminals connect via these transceivers.
  Not all pairs of transceivers can establish a connection:
  Convert the characters of the serial number into pairs of transceivers using the table below. Only pairs of these types are capable of connecting to each other.

0	1	2	3	4	5
Δ—Ω	Θ—Ψ	Ξ—X	Π—Φ	Δ—Φ	Θ—X
6	7	8	9	A	B
Ξ—Ψ	Π—Ω	Δ—Ξ	X—Ω	Δ—Θ	Θ—Π
C	D	E	F	G	H
Ξ—Ω	Δ—Δ	X—Ψ	Π—X	Ξ—Π	Φ—Φ
I	J	K	L	M	N
Θ—Φ	Φ—Ω	X—X	Π—Ψ	Δ—Π	Δ—Ψ
O	P	Q	R	S	T
Θ—Ω	Π—Π	Θ—Ξ	Δ—X	Ψ—Ω	Θ—Θ
U	V	W	X	Y	Z
Ξ—Φ	Ψ—Ψ	Φ—X	Ξ—Ξ	Φ—Ψ	Ω—Ω

- Selecting a terminal rotates it 90° clockwise and lights up the bulb at its centre.
- Submit the current configuration by rotating a terminal 360°.
  A terminal will light up green if it successfully connected to all of its neighbours, and light up red if at least one fails to connect.
